

ELECTRO-FLEX HEAT
a Division of MCF, LLC

Drum Heaters

Drum Heaters are thin, flexible electrical resistance heaters that may easily be wrapped and secured around drums, pails and tanks. They are made of silicone rubber-reinforced fiberglass cloth, laminated around a nickel alloy circuit.

This construction provides an even heat transfer, which keeps contents at proper handling or process consistency

and limits scorching or degradation of sensitive contents. A sturdy spring and hook arrangement easily attaches these products to 5, 15, 30 or 55 gal. drums.

Please contact the engineering department at Electro-Flex Heat, a Division of MCF, LLC, for assistance with specific applications.

STRONG

Our heavy hook and spring attachment will give your Drum Heater a snug fit, and has even been strength tested to tow a 3500 lb. car.

Drum Heaters may be used outdoors as long as they are protected from rain or snow.

ADAPTABLE

Drum Heaters are available for both metal and non-metal (poly or plastic) drums. Optional, molded-in thermostats are full-range adjustable and limit the temperature of the Drum Heater itself.

We also offer custom designs to fit your specific need.

RESISTANT

With applications involving adhesives, paints, oils, syrups, biofuels and many more, our Drum Heaters will stay protected and continue to operate.
